

Floating Wind Solutions

Current State of the Art of Floating Wind Turbine Design and Simulation

Chris Kubes – Principal Engineer

DNV

Organized by

Quest Offshore

FWS

The Marriott Marquis, Houston 1-3 March 2022

Purpose

- Introduction
- Project Structure of Floating Wind Design
- Tools and Workflows for Floating Wind Turbine Design
- Innovations Required
- Conclusions

Introduction

The Marriott Marquis, Houston 1-3 March 2022

Floating Wind *Solutions*

Introduction

- Significant Growth in Offshore Wind
- More Floating Wind Projects
 - R&D
 - Full Scale Deployment
 - First Commercial Floating Farms
- Floating Wind can be deployed further from shore in deeper water → more favourable wind resources

Floating Wind Solutions

Types of Floating Wind Turbines

- Semi-sub
- Spar-Buoy
- Tension Leg Platform (TLP)
- Barge

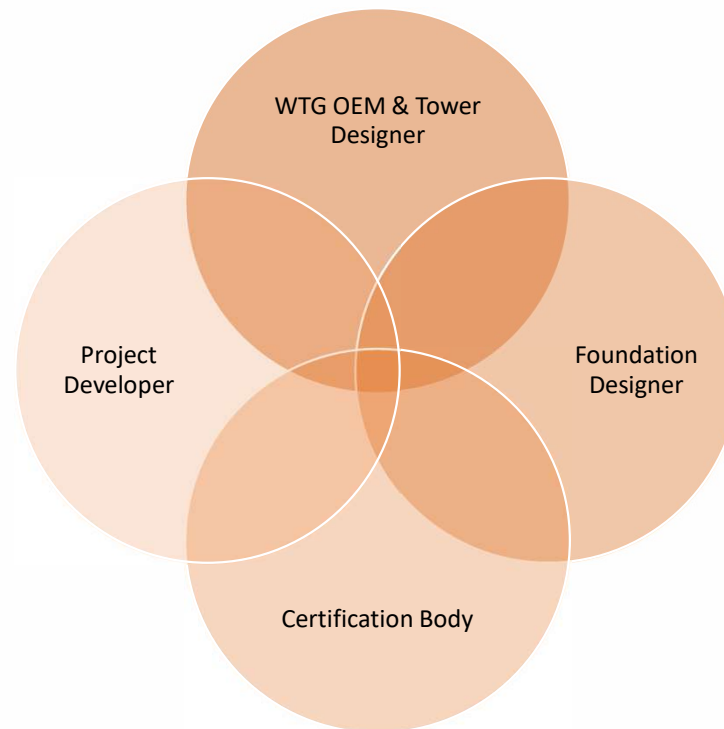

- Currently over 40 different concepts in development
- What is the “Best” Solution?

Project Structure of Floating Wind Design

Project Partners – Fixed Wind

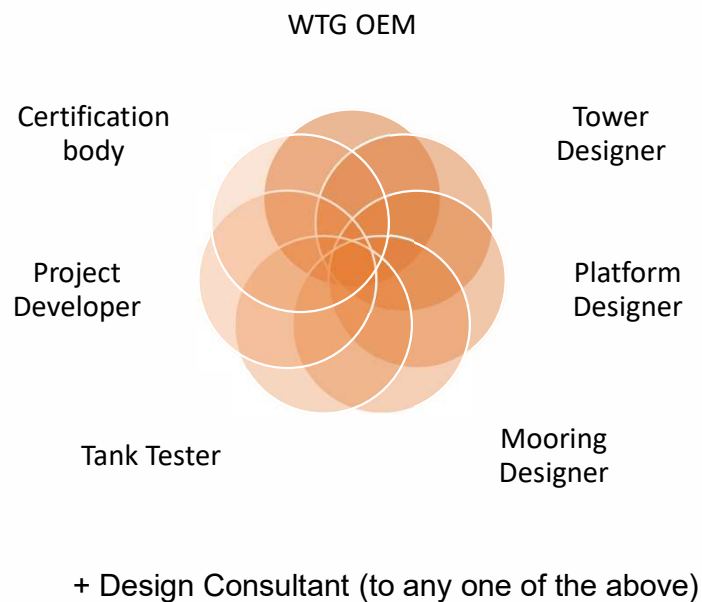

+ Design Consultant (to any one of the above)

Floating Wind Solutions

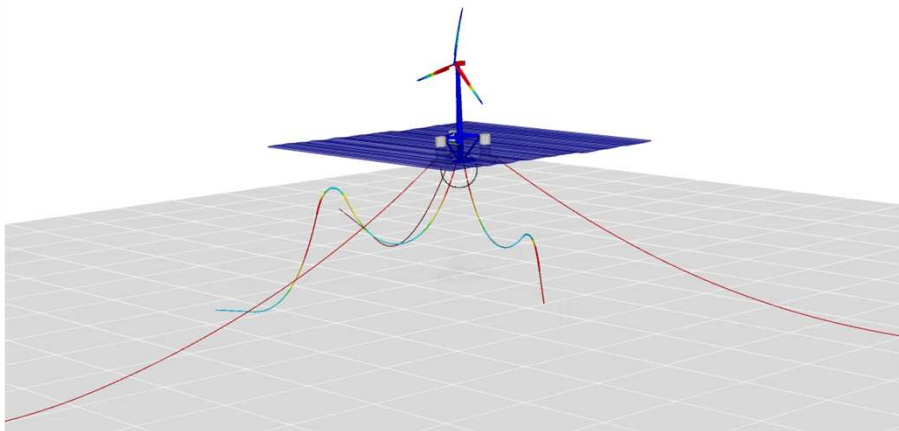

The Marriott Marquis, Houston 1-3 March 2022

Project Partners – Floating Wind

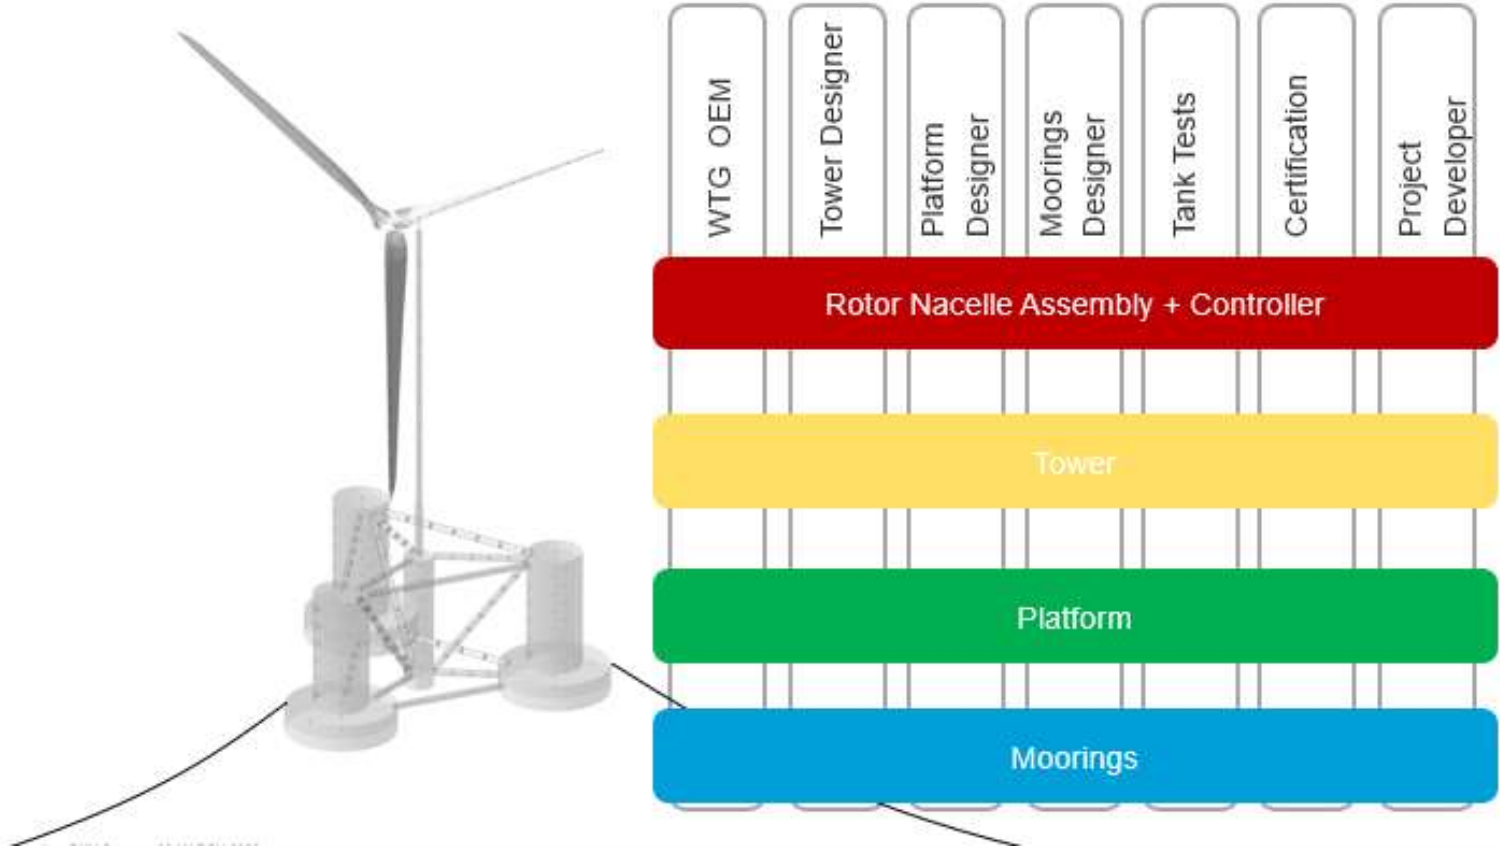

- Different software, practices and standards used... to model the same physics!
- Several verification/validation exercises required
- Joining the know-how from different industries: wind power, oil & gas and maritime
- A strong integration is required
- The practical coupling can be even more challenging than the theoretical one!

Floating Wind – The Theoretical Coupled Analysis Challenge

- Need to calculate internal **loads** and **response** for each component: wind turbine, tower, platform, moorings, ...
- It's an active system and highly coupled!
 - Aerodynamics
 - Hydrodynamics
 - Structural dynamics
 - Electrical dynamics
 - Mechanical systems
 - Controller

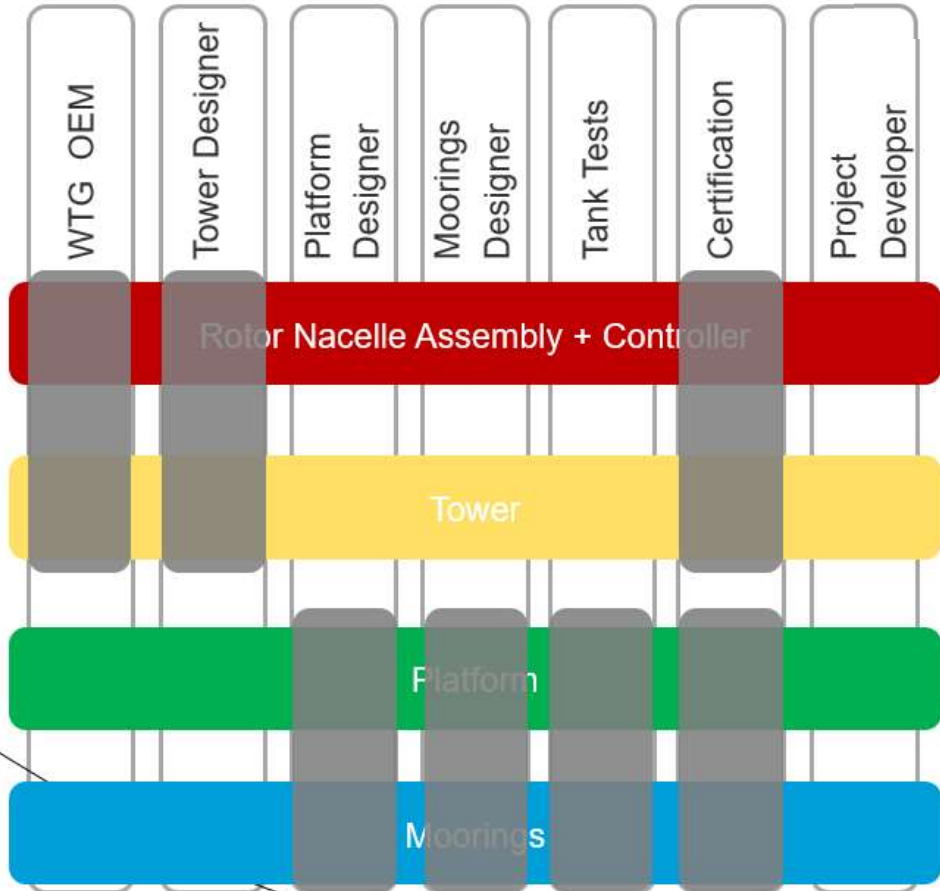

Different Approaches to Analysis & Design

Floating Wind Solutions

Different Approaches to Analysis & Design: #1 No Coupling

DNV © 03 MARCH 2022

...reating Wind Solutions

The Marriott Marquis, Houston 1-3 March 2022

Different Approaches to Analysis & Design: #2 Minimal Coupling

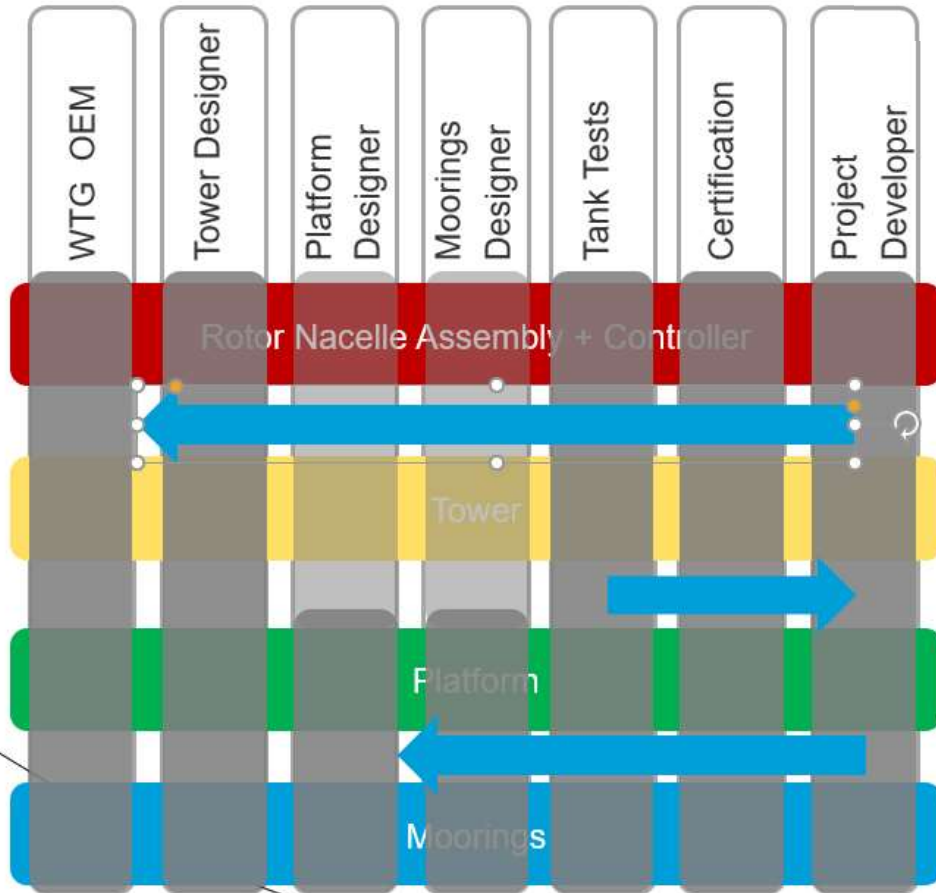

DNV © 03 MARCH 2022

Leading Wind Solutions

The Marriott Marquis, Houston 1-3 March 2022

Different Approaches to Analysis & Design: #3 Full Coupling

Wind turbine designer

Floater designer

Commercial wind turbine design tool or Academic/open aeroelastic tool

Marine dynamics tool + Offshore design tool

Challenges in the Industry

PHYSICS

Tools evolved from O&G and onshore wind

Many different floater concepts

No tools fully support floating wind turbine standards yet

INTERFACE

Protection of intellectual property gives limited willingness to exchange models and results between floater and turbine designers

Different companies using different software tools

Use of **assumptions** and **simplified** models, **inaccurate and possibly inconsistent** analysis results and an **inefficient** design process

EFFICIENCY

Large number of load cases

Full analysis requires massive amounts of **computing power** and generates extensive amounts of **data**

Innovations Required

PHYSICS

Tools to fully support floating wind turbine standards

INTERFACE

Allow for more integrated coupled design processes

EFFICIENCY

Allow for more efficient analysis processes

Conclusion and Innovations Required

Conclusion

- Many different floater designs today
- More complex project structures and simulation workflows than for fixed offshore wind
 - Floating wind turbine is highly coupled
 - Parties involved with different backgrounds and tools
- No common simulation workflow in the industry

Innovations

- Tools to fully support the floating wind standards
- Allowing for more integrated coupled design process
 - Both regarding simulation tools and project setups
- More efficient analysis processes
